## 1.0 Introduction

This report presents the activities and findings of the 1<sup>st</sup> semi-annual (Spring) 2018 groundwater monitoring event for the Coke Point and Greys Landfills at the Sparrows Point facility. Groundwater data and analyses are included to fulfill the applicable ongoing groundwater compliance monitoring requirements for the landfills as outlined in the Coke Point and Greys Landfill Sampling Plan letter received from the Maryland Department of the Environment (MDE) on December 3, 2012.

The following data collection activities occurred for the Spring 2018 monitoring event:

- water level measurements in groundwater monitoring wells;
- sampling of groundwater monitoring wells; and
- Laboratory analysis of monitoring well samples.

Results of the above investigations are described and presented in this report. This report:

- Provides field data sheets and laboratory reports documenting groundwater sample collection;
- Presents the water level data collected;
- Provides laboratory reports for sample analyses;
- Tabulates laboratory analytical data in time-series format;
- Discusses the water quality results;
- Includes location maps for the landfills with monitoring well locations posted;
- Includes groundwater contour maps for the shallow zone and intermediate groundwater zones at the landfills; and
- Includes other figures depicting analytical results for this sampling event.

## 2.0 Site and Monitoring Network Description

Coke Point Landfill occupies land on the southern edge of the Sparrows Point property located in southeastern Baltimore County (**Figure 1**). Coke Point Landfill was used for disposal of non-hazardous industrial waste generated on-site during steel production. Recent activities include recycling efforts to recover iron bearing materials from the landfill.

Greys Landfill occupies approximately 40 acres on the north side of the Sparrows Point property, between I-695 and the Peninsula Expressway (**Figure 1**). Greys Landfill has been used for the disposal of industrial waste generated on-site during steel production and is currently being utilized for ongoing non-hazardous waste disposal associated with the continuing operation of the wastewater treatment facility and demolition activities.

Monitoring well location maps are included for Coke Point and Greys Landfills (**Figures 2 and 3** respectively). Groundwater at the landfill sites is monitored via a series of monitoring wells which are typically arranged in pairs (or clusters) consisting of one shallow well and one or more intermediate wells. A summary of monitoring well construction details is presented in **Table 1**.

Shallow wells have been installed with well screens situated to monitor the unconfined shallow groundwater zone. These are considered water table wells. The vertical sections of well screen in the shallow monitoring wells typically span across mean sea level (also referred to as elevation 0 above mean sea level, or AMSL). Intermediate wells have been installed with well screens in native sand layers. Top-of-screen elevations range from -10 to -60 feet below ground surface (bgs) in depth. Intermediate wells with deeper screens are generally located near the southern edge of Coke Point Landfill. Between the shallow and the intermediate well screens, there are generally one or more layers of low permeability materials that tend to inhibit vertical groundwater movement.

## 3.0 Groundwater Monitoring Procedures

### 3.1 Coke Point Landfill

In May 2018, samples were collected from 24 wells at Coke Point Landfill for the Spring 2018 monitoring event. The locations of the monitoring wells are shown on **Figure 2**.

Analytical parameters for the groundwater samples were specified in the December 3, 2012 MDE letter. They include Table I (volatile organic compounds, or VOCs) and Table II (elements and indicator) parameters. In addition, samples from all 24 groundwater monitoring wells were analyzed for semi-volatile organic compounds (SVOCs). The wells were analyzed based on notable detections of SVOCs from review of historical data at the landfill. Laboratory analyses were performed by PACE Analytical Services using EPA methods.

Data summary tables presenting the monitoring well groundwater analytical results in time-series format are included in **Appendix A** (Table I VOCs), **Appendix B** (Table II Elements and Indicator Parameters), and **Appendix C** (SVOCs).

### 3.2 Greys Landfill

In May 2018, 32 wells were sampled at Greys Landfill for the Spring 2018 monitoring event. The locations of the monitoring wells are shown on **Figure 3**. A summary of the monitoring well construction details is presented in **Table 2**.

Analytical parameters for groundwater samples were specified in the December 3, 2012 MDE letter and included Table I (VOCs) and Table II (elements and indicator) parameters. In addition, all 32 groundwater monitoring wells were analyzed for SVOCs. The wells were analyzed based on notable detections of SVOCs from review of historical data at the landfill. Analyses were performed by Pace Laboratories, Inc. using EPA methods.

Data summary tables presenting monitoring well groundwater analytical results in time-series format are presented in **Appendix D** (Table I VOCs), **Appendix E** (Table II Elements and Indicator Parameters), and **Appendix F** (SVOCs).

### 3.3 Groundwater Sampling Procedures

Groundwater levels were measured and recorded prior to sampling a monitoring well. Water levels were measured to the nearest 0.01-foot with an electronic tape. Water levels were referenced to the top of the inner casing of the wells. Data for groundwater

levels as collected during the Spring 2018 monitoring event are tabulated and compared to previous data in **Table 3** for Coke Point Landfill and **Table 4** for Greys Landfill.

Groundwater samples were collected using a low-flow sampling methods. EnviroAnalyticsGroup, LLC (EAG) personnel utilized an electrical submersible pump with dedicated disposable tubing to purge each monitoring wells. Purging continued until field water quality parameters pH, temperature, dissolved oxygen, specific conductance, salinity, total dissolved solids (TDS), and oxidation-reduction potential (ORP) were stable. These water quality parameters were monitored during purging using a YSI meter and flow-through cell. A measurement for each field water quality parameter was recorded every five minutes. After three consecutive measurements indicated stability (defined as variance between consecutive measurements of less than ten percent for all parameters) the sample was collected.

Groundwater samples were collected in laboratory-provided bottle ware and were properly labeled. Care was taken to control flow rates so as to not over-flow sample bottles containing a preservative. A chain of custody form was completed indicating sample number, date, time, and the analyses required. Samples were stored on ice in a cooler and shipped to PACE Analytical Services, Inc. for analysis. Laboratory Certificates of Analysis and Chain of Custody forms can be provided upon request of the Department.

## 4.0 Groundwater Data Evaluation

Depth to water measurements and groundwater monitoring well survey data were used to calculate groundwater elevations and develop groundwater contour maps for the landfills. One groundwater contour map was developed for the shallow groundwater zone and a second map was developed for the intermediate groundwater zone for each landfill.

Analytical data from groundwater samples have been tabulated and evaluated with respect to detections of organic and inorganic compounds. An interpretive discussion of the findings is provided in the following sections.

### 4.1 Coke Point Landfill

#### 4.1.1 Groundwater Elevations and Contours

Groundwater elevations for the Coke Point Landfill monitoring wells collected during the Spring 2018 monitoring event are presented in **Table 3**. These measurements are also shown on groundwater contour maps for the shallow groundwater zone (**Figure 4**) and the intermediate groundwater zone (**Figure 5**). Vertical survey data are referenced to the NAVD 1988 datum.

Groundwater elevations indicate the potentiometric surface in the shallow zone has a mounded area at the north side of the landfill centered on well CP02-PZM007. This well is located furthest inland and typically has the highest groundwater elevation. Groundwater measurements usually indicate that groundwater flows away from this well to the south and southwest toward the shoreline. However, during the Spring 2018 event, groundwater was highest along the northeast edge of the landfill at well CP08-PZM008 (groundwater elevation of 8.24 feet AMSL). This is an anomalously high groundwater level for this well. Excluding CP08-PZM008 and CP02-PZM007, groundwater elevations in shallow zone monitoring wells ranged from 0.87 to 2.3 feet AMSL.

Groundwater elevations indicate the potentiometric surface in the intermediate zone is generally relatively flat, with two exceptions. The groundwater level measured in well CP16-PZM035 (8.71 feet AMSL) was anomalously high and therefore not included when generating the groundwater elevation contours shown on **Figure 5**. The other exception is the groundwater level in well CP05-PZM028, measured to be -2.79 feet AMSL. This well continues to exhibit an anomalously low groundwater elevation compared to other intermediate zone wells. This well is screened slightly lower in the intermediate zone than the other intermediate well in the well cluster, CP05-PZM019. The groundwater elevation for CP05-PZM028 was not included when generating the groundwater elevation contours shown on Figure 5. Excluding wells CP05-PZM028 and CP16-

PZM035, groundwater elevations in the intermediate zone wells ranged from 0 to 1.4 feet AMSL.

#### 4.1.2 Groundwater Quality Evaluation

##### VOCs

VOC concentrations for Coke Point Landfill are presented in **Appendix A** and displayed on **Figure 6** (shallow zone) and **Figure 7** (intermediate zone). Concentration values displayed on **Figures 6 and 7** only include the maximum concentration of all VOC detected at a given location for the Spring 2018 monitoring event.

VOC results for the shallow groundwater monitoring wells at Coke Point Landfill are shown on **Figure 6**. Benzene, acetone and toluene were the most commonly identified VOCs. The highest VOC concentration detected in the shallow zone monitoring wells was 15,800 micrograms per liter ( $\mu\text{g/L}$ ) of benzene at well CP08-PZM008. Historical data indicate that benzene values for this monitoring well have ranged between 15,000  $\mu\text{g/L}$  and 25,800  $\mu\text{g/L}$  from 2011 to present. Benzene values in other wells were much lower, with the next highest concentration being 2,760  $\mu\text{g/L}$  at well CP19-PZM008.

The most impacted well in the shallow zone—CP08-PZM008—is located on the east side of the landfill. The closest shoreline is approximately 1,200 feet to the south of the monitoring well. Groundwater likely flows along a slight gradient to the south towards the shoreline.

Five wells (CP19-PZM008, CP16-PZM008, CP18-PZM009, CP20-PZM011, CP21-PZM004) screened in the shallow zone were added to the network in the Spring 2015 monitoring event. Each of these wells is located in the surrounding area of CP08-PZM008 as shown on **Figure 6**. The table below compares the benzene levels in groundwater at the newly added wells to the benzene levels at CP08-PZM008.

WELL	LOCATION TO CP08-PZM008	BENZENE $\mu\text{g/L}$
CP08-PZM008		15,800
CP19-PZM008	Southwest of CP08	2,760
CP16-PZM008	South of CP08 against shoreline	62.1
CP18-PZM009	South of CP08	943
CP20-PZM011	East of CP08	97.1
CP21-PZM004	North of CP08	1.7

Based on the data shown in this table, the nature and extent of benzene identified at CP08-PZM008 has been defined and is confined to the vicinity of CP08-PZM008.

VOC results for the intermediate zone groundwater monitoring wells at Coke Point Landfill are shown on **Figure 7**. Groundwater VOC concentrations are lower in the intermediate zone than in the shallow zone, with the highest VOC concentration being 121 µg/L of benzene detected at well CP16-PZM035. Historical data indicate that benzene values for this monitoring well have been relatively stable since April 2011, ranging from 290 µg/L to 121 µg/L. All other intermediate monitoring wells have maximum VOC concentrations less than 80 µg/L.

### SVOCs

SVOC results for Coke Point Landfill are presented in **Appendix B**. SVOCs are not listed as part of the Table I and Table II requirements outlined in the December 3, 2012 letter; however, monitoring wells were analyzed for SVOCs based on recommendations from a previous groundwater compliance report for Coke Point Landfill published in 2011.

In the Spring 2018 monitoring event, 24 groundwater monitoring wells were sampled and analyzed for SVOCs. SVOC results for the Coke Point Landfill are displayed on **Figure 6** (shallow zone) and **Figure 7** (intermediate zone).

SVOCs were detected in all of the groundwater monitoring wells that were sampled. Shallow wells generally had higher SVOC concentrations than intermediate wells. The highest SVOC concentration detected was 341 µg/L of naphthalene at well CP08-PZM008, which is located in the shallow zone. This is much less than the highest detection of naphthalene ever reported in CP08-PZM008 (6,320 µg/L in the Fall 2016 monitoring event) since first being sampled in 2011. The highest SVOC concentration detected in the intermediate groundwater zone was 51.5 µg/L of naphthalene located at CP16-PZM035. This well has a range of 18.7 µg/L to 189 µg/L of naphthalene since 2011.

### Inorganics

Inorganic compound data for Coke Point Landfill are presented in **Appendix C**. Concentrations of arsenic, chromium and lead for each well are displayed on **Figure 8** (shallow zone) and **Figure 9** (intermediate zone). These metals were selected to act as representative indicators of impacts to groundwater.

The concentrations shown on **Figure 8** for the shallow groundwater zone indicate that all three indicator metals were below 0.05 milligrams per liter (mg/L) for all monitoring wells. The highest concentration for each of the indicator metals in the shallow zone

was 0.0384 mg/L of arsenic at CP02-PZM007, 0.0457 mg/L of chromium at CP20-PZM011, and 0.008 mg/L of lead at CP09-PZM010.

Concentrations of the three representative metals in the intermediate groundwater wells at Coke Point Landfill are shown on **Figure 9**. The concentrations were significantly lower than in the shallow zone. The highest concentration for each of the indicator metals in the intermediate zone was 0.0114 mg/L of arsenic at CP12-PZM052, 0.0047 mg/L of chromium at CP05-PZM028, and 0.0023 mg/L of lead at CP15-PZM042. These results confirm limited impacts to intermediate groundwater from site activities and provide evidence for the lack of vertical groundwater migration (migration between the shallow and intermediate zones).

## **4.2. Greys Landfill**

### **4.2.1 Groundwater Elevations and Contours**

Groundwater elevations for the Greys Landfill monitoring wells collected during the Spring 2018 monitoring event and are presented in **Table 4**. These data were developed into groundwater contour maps for the shallow groundwater zone (**Figure 10**) and the intermediate groundwater zone (**Figure 11**). Vertical survey data are referenced to the NAVD 1988 datum.

**Figure 10** shows representative groundwater levels and groundwater contours for the shallow zone monitoring wells. Groundwater elevations indicate the potentiometric surface in the shallow zone is highest at the southern edge of the landfill at well GL-13 (+1) (groundwater elevation of 13.46 feet AMSL). The potentiometric surface indicates that groundwater flows to the northwest. Groundwater elevations in shallow zone monitoring wells ranged from 0.88 to 13.46 feet AMSL.

Groundwater elevations for the intermediate wells are shown on **Figure 11**. The highest groundwater elevation in the intermediate zone was measured at well GL-09 (-20) (groundwater elevation of 6.16 feet AMSL). Excluding GL-09 (-20) and well GL-03 (-16) (groundwater elevation of 4.28 feet AMSL), groundwater elevations for the intermediate wells ranged from 0.22 to 1.12 feet AMSL. The elevations measured for this monitoring event indicate an east-to-west flow gradient near the eastern edge of the landfill, but a relatively flat potentiometric surface near the central and western portions of the landfill.

## 4.2.2 Groundwater Quality Evaluation

### VOCs

VOC results for Greys Landfill monitoring wells are presented in **Appendix D** and are also shown on **Figure 12** (shallow zone) and **Figure 13** (intermediate zone). Concentrations displayed on **Figures 12 and 13** only include the maximum VOC or SVOC concentration detected at a given well during the Spring 2018 monitoring event.

During this monitoring event, well GL-17 (-1) located on the north side of the landfill exhibits the highest concentrations of VOCs. This well had a benzene concentration of 6,070 µg/L. The benzene concentration in this well has generally been decreasing over the last six monitoring events. Groundwater in this area is flowing to the west/northwest. It is evident from the concentrations displayed on Figure 12 that VOC impact is significantly attenuated with distance from the landfill in the shallow zone. There is a significant decrease in VOC concentrations from well GL-17 (-1) to wells GL-02 (-5) and TS-01 (-7), moving towards Bear Creek. Benzene was detected at a concentration of 12 µg/L in well TS-01 (-7) and was not detected in well GL-02 (-5). It is also evident from concentrations displayed on Figure 12 that there is minimal VOC impact in the shallow zone south of the landfill or west of the landfill, adjacent to Bear Creek.

VOC results are shown for the intermediate groundwater monitoring wells at Greys Landfill on **Figure 13**. For the intermediate zone, VOC concentrations are typically significantly lower than in the shallow zone. In well GL-14 (-33), concentrations of benzene have greatly fluctuated from December 2014 to the recent Spring 2018 monitoring event. The lowest concentration of benzene in this well during this time frame was during the Spring 2018 monitoring event when it was not detected, whereas the highest concentration was 2,470 µg/L detected during the Fall 2015 monitoring event. This intermediate well will continue to be monitored closely for increases or decreases in VOC concentrations during future sampling events.

### SVOCs

SVOC results for Greys Landfill are presented in **Appendix E**. SVOCs are not listed as part of the Table I and Table II requirements outlined in the December 3, 2012 letter; however, monitoring wells were analyzed for SVOCs based on recommendations from a previous groundwater compliance report for Greys Landfill published in 2011. SVOC results for Greys Landfill are displayed on **Figure 12** (shallow zone) and **Figure 13** (intermediate zone).

SVOCs were detected in 12 shallow groundwater monitoring wells. The data indicate the wells most impacted by SVOCs are GL-18 (-3), GL-08 (-3), GL-17 (-1), and GL-09(-2).

These wells are located in the shallow zone on the north and northeast sides of the landfill. The highest SVOC concentrations in the shallow zone were detected at wells GL-18 (-3) and GL-08(-3) with naphthalene concentrations of 5,770 µg/L and 1,890 µg/L, respectively. Naphthalene concentrations for GL-18 (-3) and GL-08(-3) have significantly fluctuated over the past four years.

SVOCs were detected in 12 out of 15 intermediate groundwater monitoring wells. The highest SVOC concentration in the intermediate zone was at well GL-03 (-16), where 2-Chloronaphthalene was detected at a concentration of 9 µg/L. Based on review of historical SVOC data, there have been minimal SVOC detections in intermediate zone wells since 2010.

### **Inorganics**

Inorganic compound data for Greys Landfill are presented in **Appendix F**. Individual results for arsenic, chromium and lead are displayed on **Figure 14** (shallow zone) and **Figure 15** (intermediate zone). These metals were selected to act as representative indicators of impacts to groundwater.

Review of the representative metal data shown on **Figure 14** indicates that in the shallow wells, all detections of indicator metals were below 0.2 mg/L. The highest concentration for each indicator metal in the shallow zone was: 0.0208 mg/L of arsenic at GL-09 (-2), 0.14 mg/L of chromium at GL-15 (-6), and 0.038 mg/L of lead at GL-02 (-5).

Concentrations of the three representative metals in the intermediate groundwater zone wells are shown on **Figure 15**. The highest concentration for each indicator metals was 0.0132 mg/L of arsenic at GL-09 (-20), 0.0049 mg/L of chromium at GL-15 (-36), and 0.0019 mg/L of lead at GL-05 (-25). Generally, concentrations of indicator metals were lower in the intermediate zone than the shallow zone.

## 5.0 Historical Trends and Analysis

The following sections provide a discussion and analysis of general historical trends in the data by comparing data collected and reported by previous owners of the landfills to the Spring 2018 data. Analysis, such as intra-well statistical methods, will be completed in the future when additional data have been collected to provide sufficient input for a statistically valid data set.

### 5.1 Coke Point Landfill

Concentrations of VOCs in shallow groundwater monitoring data have remained fairly consistent over recent years. Well CP08-PZM008 located on the east side of the landfill, has exhibited stable benzene concentrations from May 2016 up through the Fall 2017 event. The Spring 2018 sampling event exhibited a decreased benzene concentration in this well. Wells surrounding CP08-PZM008 (CP16-PZM008, CP18-PZM009, CP19-PZM008, and CP21-PZM004) generally exhibited stable benzene concentrations as well. Although groundwater at these well locations is impacted with VOCs, the concentrations are less than that of CP08-PZM008.

Intermediate zone well CP16-PZM035 has exhibited a trend of stable or decreasing VOCs over the past five years. Benzene concentrations have ranged from 281 µg/L in December 2014 to 121 µg/L in May 2018. Most other intermediate wells at Coke Point Landfill have had no detectable levels of benzene. Trends in benzene concentrations will continue to be monitored during future sampling events.

Acetone was not detected in well CP15-PZM042 from April 2011 to December 2015. During the November 2016 monitoring event, acetone was detected in this well at a concentration of 227 µg/L. Since that time, concentrations have notably fluctuated. The concentration of acetone in this well was 79 µg/L during the Spring 2018 monitoring event. Acetone will continue to be monitored for increases or decreases in CP15-PZM042 during future sampling events.

There were no other notable trends (either increasing or decreasing) for the SVOCs or inorganic compounds in both the shallow and intermediate zone at Coke Point Landfill.

### 5.2 Greys Landfill

Concentrations observed for Greys Landfill groundwater monitoring of VOCs and SVOCs in both the shallow and intermediate zones are generally consistent with historical values and trends, with a few exceptions. In shallow well GL-08 (-3), a number of VOCs were detected for the first time during the October 2013 sampling event.

Concentrations of these parameters have generally been decreasing since the May 2015

monitoring event. In well GL-09 (-2), concentrations of acetone and 2-butanone continue to exhibit notable fluctuations from event to event.

The concentration of benzene in intermediate zone well GL-14 (-33) has notably fluctuated over the past five years. Otherwise, SVOC and VOC concentrations in the intermediate zone wells are relatively low and have shown minor changes over the past five years.

Results for inorganics in the groundwater at Grey's Landfill for the Spring 2018 monitoring event remain within historical concentration ranges. In the shallow zone, no significant increases or decreases were noted. Intermediate well concentrations remained fairly consistent with historical trends.

## **6.0 Recommendations**

The groundwater monitoring program for both Coke Point and Greys Landfills is adequate as currently implemented. Groundwater wells are adequately located to monitor impacts to both shallow and intermediate groundwater zones around both landfills. Semi-annual groundwater monitoring events will continue to be performed to sample and analyze groundwater from these land disposal units.
