

**Annual Drinking Water Quality Report for 2021**

**South View-Wise Well**

**PWSID MD 0080041**

**June, 2022**

Again, we're pleased to provide you with the 2021 calendar year Annual Water Quality Report. We would like to keep you informed about the excellent water and services we have been attempting to deliver to you in 2021. Our goal is to provide to you a safe and dependable supply of drinking water. Our water source is one well drilled to a depth of 300 feet which draws from the confined Aquia Aquifer. This well is located on South View Road. It is owned by the Wise Estate and managed by the members of the SVHOA (South View Homeowners Association).

This report shows our water quality and what it means.

A source water assessment plan has been prepared that provides more information such as potential sources of contamination. This plan is available thru the Charles County Public Library or Maryland Department of the Environment (MDE).

If you have any questions about this report or concerning your water, please contact G. Gale Willett at 301-399-3213 or e-mail at [g.willett@att.net](mailto:g.willett@att.net). The association provides each homeowner with a yearly report on the health of the well system. An annual meeting is held each spring for the twenty-four (24) association members, at which time any problems or concerns can be brought forward for discussion. Everyone is encouraged to attend the annual meeting.

**"South View" (SVHOA) ROUTINELY MONITORS FOR CONTAMINANTS IN YOUR DRINKING WATER ACCORDING TO Federal and State laws.** As water travels over the land or underground, it can pick up substances or contaminants such as microbes, inorganic, organic chemicals and radioactive substances. All drinking water, including bottles of **DRINKING WATER**, may be reasonably expected to contain at least small amounts of some contaminants. It's important to remember that the presence of these contaminants does not necessarily pose a health risk.

MDE has provided an annual drinking water quality report for 2021 dated April 15, 2021 which is enclosed. This report shows the results of our monitoring for the period of January 1<sup>st</sup> to December 31<sup>st</sup>, 2021. In this report you will find many terms and abbreviations you might not know. To help you better understand these terms we've provided the following definitions:

**Parts per million (ppm) or Milligrams per liter (mg/l)** – one part per million corresponds to one minute in two years or a single penny in \$10,000.

**Parts per billion (ppb) or Micrograms per liter** – one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

**Action Level** – The concentration of a contaminant which if exceeded triggers treatment and/or other requirements which a water system must follow.

**Maximum Contaminant Level (MCL)** – The “Maximum Allowed” (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology. MCLs are set at very stringent levels. To understand the possible health effects described for many regulated contaminants, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the described health effect.

**Maximum Contaminant Level Goal (MCLG)** – The “Goal” (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

- 1) The water is tested monthly for total coliform bacteria, fecal coliform and e-coli. None of these bacteria's were detected in the 12 routine samples submitted for analysis in 2021 and January, February, March, April and May of 2022. Total coliform was found after well cleaning & chlorination treatment in the fall of 2021 & later water tests were clear.
- 2) The water is tested annually for nitrates (likely source of contamination is runoff from fertilizer use), leaching from septic tanks, sewage and erosion of natural deposit. No detection of nitrates in the sample submitted for analysis in 2021.
- 3) Maryland Department of Environmental tested the well water for radioactive contaminants and sampled for Gross Alpha and Radium-228 in 2020. No violations were found. Next scheduled testing is 2029.
- 4) The water was analyzed for metals in September, 2020 and no violations were found.
- 5) In 2020 lead and copper testing was performed on five (5) residences. Four (4) residences had negative results for lead and copper. One (1) residence tested positive for copper well below the MCLG and was provided the copper water sample result report which includes all copper warnings and steps to reduce exposure to lead in drinking water. Lead and copper testing will be conducted in 2023.
- 6) Sodium, a non-regulated contaminant was detected in the water system. No MCL exists for sodium and the reporting of sodium is optional for the Consumer Confidence Report. We feel all should know all water testing results. Sodium can have an aesthetic effect (taste). More information on sodium in drinking water, is available at [www.epa.gov](http://www.epa.gov).

The water was tested for volatile organic compounds (VOC) by the Maryland Department of the Environment on April 2, 2022. VOC was not detected. The VOC test is expected to be repeated by MDE in 2028.

The water was tested for synthetic organic compounds (SOC) on November 1, 2018. No SOC's were detected. The SOC Test is expected to be repeated in 2027.

*If present, elevated level of lead can cause health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. SVHOA is responsible for providing high quality drinking water, but cannot control the variety of materials used in your household plumbing components.*

*When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your drinking water you may wish to have it tested. Information on lead in drinking water, testing methods and steps you can take to minimize exposure is available from EPA Safe Drinking Water Hotline at 1-800-426-4791 or at <http://www.epa.safewater/lead>. One house was reported as having lead at the minimum level of detection.*

As you can see by the tables and testing results in 2021 we are proud that your drinking water meets or exceed all Federal and State requirements. We have learned through our monitoring and testing that some contaminants have been detected. The EPA has determined that your water **IS SAFE** at these levels.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or manmade. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All DRINKING WATER including BOTTLED WATER may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immune-compromised persons such as persons with cancer undergoing chemotherapy, person who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk for infections. These people should seek advice about drinking water from their health care providers, EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline. (1-800-426-4791)

**Conservation Tips:**

*The average household uses approximately 350 gallons of water per day.*

*Suggestions to conserve our water:*

- 1) Water lawns during the least sunny times of the day*
- 2) Fix any toilet or faucet leaks in your home (including water lines to external buildings and piers).*
- 3) Take short showers (5 minute shower uses 4-5 gallons of water)/taking a bath uses up to 50 gallons.*
- 4) Turn off faucet when shaving or brushing your teeth.*
- 5) Teach children about water conservation.*

***REMEMBER: All water going down the drain goes into your onsite sewage system.***

**Water Quality Tip:**

*Remove and clear faucet strainers, shower heads and washer strainers of any foreign materials.*

**Septic Tip:**

***Flushable wipes, regardless of what the package says, are detrimental to on site septic systems by causing blockages in the lines which are expensive to fix and reduces your septic system's life. Every septic company will tell you this.***

***If you are not already aware, Charles County may reimburse you up to \$187.50 once every three (3) years for pumping out your septic system. The Charles County Government website has more information on this topic and some septic services will provide you with the form.***

## **IMPORTANT INFORMATION**

The following pages comprise the Annual Consumer Confidence Report (CCR) for your water system.

To download the CCR into your word processing program, follow these steps. Remember you must have the document set up in Landscape Orientation.

- \* Choose Select All from the edit drop down MENU. (it will highlight all the information)
- \* Choose Edit from the Menu, select Copy from the edit dropdown Menu.
- \* Open your word processing program.
- \* Choose Edit from the MENU, select Paste from the edit dropdown MENU and the information will transfer.
- \* Choose Edit from the Menu.

In order to meet all the requirements of the CCR, you must include the following additional information if it pertains to your water system.

- \* The report must include the telephone number of the owner, operator, or designee of the community water system as a source of additional information concerning the report.
- \* In communities with a large proportion of non-English speaking residents, as determined by the Primacy Agency, the report must contain information in the appropriate language(s) regarding the importance of the report or contains a telephone number or address where such residents may contact the system to obtain a translated copy of the report and/or assistance in the appropriate language.
- \* The report must include information about opportunities for public participation in decisions that may affect the quality of the water (e.g., time and place of regularly scheduled board meetings).
- \* If your water system purchases water from another source, you are required to include the current CCR year's Regulated Contaminants Detected table from your source water supply.
- \* If your water system had any violations during the current CCR Calendar year, you are required to include an explanation of the corrective action take by the water system.
- \* If your water system is going to use the CCR to deliver a Public Notification, you must include the full notice and return a copy of the CCR and Public Notice with the public Notice. This is in addition to the copy and certification form required by the CCR Rule.
- \* The information about likely sources of contamination provided in the CCR is generic. Specific information regarding contaminants may be available in sanitary surveys and source water assessments and should be used when available to the operator.
- \* If a community water system distributes water to its customers from multiple hydraulically independent distribution systems fed by different raw water sources, the table should contain a separate column for each service area, and the report should identify each separate distribution system. Alternatively, systems may produce separate reports tailored to include data for each service area.

- \* Detections of unregulated contaminants for which monitoring is required are not included in the CCR and must be added. When added, the information must include the average and range at which the contaminant was detected.
- \* If a water system has performed any monitoring for Cryptosporidium, including monitoring performed to satisfy the requirements of the Information Collection Rule [ICR] (141:143), which indicates that Cryptosporidium may be present in the source water or the finished water, the report must include: (a) a summary of the results of the monitoring; and (b) an explanation of the significance of the results.
- \* If a water system has performed any monitoring for radon which indicate that radon may be present in the finished water, the report must include: (a) The results of the monitoring; and (b) An explanation of the significance of the results.
- \* If a water system has performed additional monitoring which indicates the presence of other contaminants in the finished water, EPA strongly encourages systems to report any results which may indicate a health concern. To determine if results may indicate a health concern, EPA recommends that systems find out if EPA has proposed an NPDWR or issued a health advisory for that contaminant by calling the Safe Drinking Water Hotline (800-426-4791). EPA considers detects above a proposed MCL or health advisory level to indicate possible health concerns. For such contaminants, EPA recommends that the report include: (a) the results of the monitoring; and (b) an explanation of the significance of the results noting the existence of a health advisory or a proposed regulation.
- \* If you are a groundwater system that receives notice from a state of a significant deficiency, you must inform your customers in your CCR report of any significant deficiencies that are not corrected by December 31 of the year covered by it. The CCR must include the following information:
  - The nature of the significant deficiency and the date it was identified by the state.
  - If the significant deficiency was not corrected by the end of the calendar year, include information regarding the State-approved plan and schedule for correction, including interim measures, progress to date, and any interim measures completed.
  - If the significant deficiency was corrected by the end of the calendar year, include information regarding how the deficiency was corrected and the date it was corrected.

# Annual Drinking Water Quality Report

MD0080041

SOUTHVIEW WISE

Annual Water Quality Report for the period of January 1 to December 31, 2021

This report is intended to provide you with important information about your drinking water and the efforts made by the water system to provide safe drinking water.

SOUTHVIEW WISE is Ground Water

For more information regarding this report contact:

Name George "Gale" Willett

Este informe contiene información muy importante sobre el agua que usted bebe. Tradúzcalo ó hable con alguien que lo entienda bien.

## Sources of Drinking Water

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminant's and potential health effects can be obtained by calling the EPAs Safe Drinking Water Hotline at (800) 426-4791.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.

- Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Some people may be more vulnerable to contaminants in drinking water than the general population.

Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We are responsible for providing high quality drinking water, but we cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

## Source Water Information

SWA = Source Water Assessment

Source Water Name

SOUTHVIEW WISE CH930261

Type of Water	Report Status	Location
GW	Y	NEAR 2.7 MI SW OF NEWBURG APPROX. 90 FT S OF SOUTH VIEW ROAD

## Lead and Copper

Definitions:

Action Level Goal (ALG): The level of a contaminant in drinking water below which there is no known or expected risk to health. ALGs allow for a margin of safety.

Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Lead and Copper	Date Sampled	MCLG	Action Level (AL)	90th Percentile	# Sites Over AL	Units	Lead and Copper	Likely Source of Contamination
Copper	09/15/2020	1.3	1.3	0.03	0	ppm	Copper	Erosion of natural deposits; Leaching from wood preservatives; Corrosion of household plumbing systems.

## Water Quality Test Results

Definitions:

Avg:

Maximum Contaminant Level or MCL:

Level 1 Assessment:

Maximum Contaminant Level Goal or MCLG:

Level 2 Assessment:

Maximum residual disinfectant level or MRDL:

Maximum residual disinfectant level goal or MRDLG: The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

na:

mrem: millirems per year (a measure of radiation absorbed by the body)

micrograms per liter or parts per billion - or one ounce in 7,350,000 gallons of water.

milligrams per liter or parts per million - or one ounce in 7,350 gallons of water.

## **Water Quality Test Results**

Treatment Technique or TT:

A required process intended to reduce the level of a contaminant in drinking water.

### Regulated Contaminants

Inorganic Contaminants						
	Collection Date	Highest Level Detected	Range of Levels Detected	MCLG	MCL	Units
<b>Barium</b>	09/17/2020	0.0015	0.0015 - 0.0015	2	2	ppm
<b>Fluoride</b>	09/17/2020	0.16	0.16 - 0.16	4	4.0	ppm
<b>Selenium</b>	09/17/2020	1.1	1.1 - 1.1	50	50	ppb
Radioactive Contaminants						
	Collection Date	Highest Level Detected	Range of Levels Detected	MCLG	MCL	Units
<b>Beta/photon emitters</b>	03/12/2020	10.6	10.6 - 10.6	0	50	pCi/L
<b>Combined Radium 226/228</b>	03/12/2020	0.2	0.2 - 0.2	0	5	pCi/L
