

Important Information Concerning Your Drinking Water

e're pleased to present to you the Annual Water Quality Report for 2021. This report is designed to inform you about the water quality and services we deliver to you every day. Maryland Environmental Service, an Agency of the State of Maryland, began operating the water treatment facility in January 2002 and prepared this report on behalf of the Town of Darlington.

The Environmental Protection Agency (EPA) regulates Public Water Systems and the contaminants found in water through the implementation of the Safe Drinking Water Act (SDWA). The SDWA sets regulations and guidelines for how public water systems operate and identifies several hundred drinking water contaminants, establishes monitoring frequencies and limitations. The Maryland Department of the Environment (MDE) is responsible for the enforcement of the SDWA and routinely complete Sanitary Surveys as part of there ongoing inspection and monitoring program. MES provides safe dependable operations of the water system and is dedicated to consistently providing high quality drinking water that meets or exceeds the SDWA standards.

If you have any questions about this report or have questions concerning your water utility, please contact **Jay Janney at 410-729-8361, e-mail jjanney@menv.com**.

Public Meeting Information:

For the opportunity to ask more questions or participate in decisions that may affect your drinking water quality, please contact Jay Janney at 410-729-8361 and/or refer to MES website at http://www.menv.com for schedule and meeting location information.

Polyfluoroalkyl Substances	4	
Lead Prevention	4	
Sources of Drinking Water	4	

ome people may be more vulnerable to contaminants in drinking water than the population. Immuno-compromised general persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe **Drinking Water Hotline (1-800-426-4791).**

Town of Darlington Treated Water Quality Report 2021

Definitions:

- ♦ Maximum Contaminant Level Goal (MCLG) The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
- ♦ Maximum Contaminant Level (MCL) The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
- ◆ **Action Level** The concentration of a contaminant which, if exceeded, triggers treatment of other requirements which a water system must follow.
- ◆ **Treatment Technique (TT)** A required process intended to reduce the level of a contaminant in drinking water.
- ◆ **Turbidity** Relates to a condition where suspended particles are present in the water. Turbidity measurements are a way to describe the level of "cloudiness" of the water.
- ◆ NTU Nephelometric Turbidity Units. Units of measurement used to report the level of turbidity or "cloudiness" in the water.
- ◆ pCi/I Picocuries per liter. A measure of radiation.
- ◆ ppb parts per billion or micrograms per liter.
- ◆ ppm parts per million or milligrams per liter.
- ◆ ppt parts per trillion or nanograms per liter.

Special points of interest:

The Town of Darlington's water is tested for over 120 different compounds. The Town of Darlington's Drinking Water met all of the State and Federal requirements Drinking Water, including bottled water, may reasonably be expected to contain at least small amounts of some compounds. The presence of these compounds does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the **Environmental Protection Agency's (EPA's) Safe Drinking Water Act Hotline (1-800-426-4791).**

Water Security is Everyone's Responsibility

Water system security continues to be an enormously important issue. If you notice suspicious activities in or around local water utilities, such as persons cutting or climbing facility fencing, loitering, tampering with equipment or other similar activities, please contact your local law enforcement agency immediately by dialing 911.

Town of Darlington Treated Water Quality Report 2021

Contaminant	Highest Level Allowed (EPA's MCL)	Highest Level Detected	Ideal Goal (EPA's MCLG)	
Regulated at the Treatment Plant				
Wells 1 & 2				
Nitrate	10 ppm	3.6 ppm	10 ppm	
Source: Erosion of natural deposits, runoff from fertilizer, and leaching from septic tanks and sewage				
Regulated in the Distribution System	Highest Level Allowed (EPA's MCL)	Highest Level Detected	Ideal Goal (EPA's MCLG)	
Total Trihalomethanes (TTHM) (2020 Testing)	80 ppb	17.1 ppb	n/a	
Haloacetic Acids (HAA5) (2020 Testing)	60 ppb	6.7 ppb	n/a	
Source: By-product of drinking water disinfection	n			
Chlorine	4 ppm	0.85 ppm *	4 ppm	
*Annual rolling average		(Range: 0.80 - 0.85)		
Source: Water additive used to control microbes.				
Regulated at the Consumer's Tap	Action Level	90 Percentile	Goal	
Copper (2020 Testing)	1.3 ppm	0.35 ppm	1.3 ppm	
Lead (2020 Testing)	15 ppb	<0.002 ppb	0 ppb	
Source: Corrosion of household plumbing fixtures and systems, erosion of natural deposits, and wood perservatives				

The table above lists all the drinking water contaminants that were detected during the 2021 calendar year. The presence of these compounds in the water does not necessarily indicate that the water poses a health risk. Unless otherwise noted, the data presented in the table is from conducted between January 1 – December 31, 2021. The State requires monitor of certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year.

Contaminants That May Be Present in Source Water:

Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife. Pesticides and Herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses. Inorganic Contaminants, such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming. Organic Chemical Contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems. Radioactive Contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

The drinking water for the Town of Darlington consists of water from two wells in the Quartz Gabbro and Diorite Gneiss rock formations. Water is pumped out of the wells and a corrosion inhibitor is added for corrosion control. In addition, a disinfectant is added to protect against microbial contaminants. The Maryland Department of the Environment has completed an assessment of the source water. If you are interested in receiving a copy of the source water assessment report please call Jay Janney at 410-729-8361 or email your request to ijanney@menv.com.

Town of Darlington Treated Water Quality Report 2021

Sources of Drinking Water

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain compounds in water provided by public water systems. We treat our water according to EPA's regulations. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Polyfluoroalkyl Substances

PFAS – short for per- and polyfluoroalkyl substances – refers to a large group of more than 4,000 human-made chemicals that have been used since the 1940s in a range of products, including stain- and water-resistant fabrics and carpeting, cleaning products, paints, cookware, food packaging and fire-fighting foams. These uses of PFAS have led to PFAS entering our environment, where they have been measured by several states in soil, surface water, groundwater and seafood. Some PFAS can last a long time in the environment and in the human body and can accumulate in the food chain.

Currently, there are no federal regulations (i.e. Maximum Contaminant Levels (MCLs)) for PFAS in drinking water. However, the U.S. Environmental Protection Agency (EPA) has issued a Health Advisory Level (HAL) of 70 parts per trillion (ppt) for the sum of PFOA and PFOS concentrations in drinking water. While not an enforceable regulatory standard, when followed, the EPA HAL does provide drinking water customers, even the most sensitive populations, with a margin of protection from lifetime exposure to PFOA and PFOS in drinking water. Beginning in 2020, the Maryland Department of the Environment (MDE) initiated a PFAS monitoring program. *The combined PFOA and PFAS concentration from samples taken from your water system was 8.8 ppt.* MDE anticipates that EPA will establish an MCL for PFOA and PFOS in the near future. This would entail additional monitoring. Additional information about PFAS can be found on the MDE website: mde.maryland.gov"

Lead Prevention

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Town of Darlington is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your drinking water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the EPA Safe Drinking Water Hotline at 1-800-426-4791 or at http://www.epa.gov/safewater/lead.

If you have any questions about this report or your drinking water, please call Jay Janney at 410-729-8350 or email your request to <u>jjanney@menv.com</u>.
