Appendix D - Record of Dissolved Oxygen Monitoring

**DEEP CREEK HYDROELECTRIC STATION
MDE WATER APPROPRIATION PERMIT NO. GA92S009 (03)
ANNUAL REPORT for 2001**

1.0 SUMMARY

Reliant Energy Maryland Holdings, LLC (Permittee) holds Water Appropriation Permit GA92S009(03) issued by the Maryland Department of the Environment (Department). Permit GA92S009(03) provides for the continued operation of the Deep Creek Hydroelectric Station.

Permit Condition 23 requires the Permittee to submit an annual report to the Department, including data and information as specified in Permit Conditions 15-19 and 21.

1.1 Lake Level Monitoring

Appendix A contains daily water level data for 2001. Lake levels exceeded the desired end of the month Upper Rule Band by 0.2 feet in February, 0.4 feet in March, 0.1 feet in April and 0.3 feet in May. The maximum desirable reservoir levels at the end of each month were attained in January and June through December. Water levels in the reservoir were maintained above the Lower Rule Band for the entire year.

The reservoir levels were above or near the Upper Rule Band for much of May and June. Over 3.5 inches of rain fell during the last half of the May, resulting in higher than normal reservoir levels. The highest reservoir level in May was 2461.5 feet, 0.5 feet above the Upper Rule Band. The highest water elevation during the year was 2461.7 feet on June 8, 0.7 feet above the rule band. The reservoir received over 2.5 inches of rain between June 1 and June 7. Water levels in the reservoir were within the rule bands from July 11 through the end of the year.

1.2 Temperature Monitoring

The Permittee monitored water temperature in the Youghiogheny River in accordance with "Deep Creek Station, Water Temperature Enhancement Plan" (approved June 8, 1996, revised September 2001). The Plan was designed to maintain river water temperatures below 25°C in the Youghiogheny River. The Permittee released water in accordance with the Water Temperature Enhancement Plan on twelve days in 2001. River water temperatures exceeded 25°C on June 19, 26, 28 and 30; July 1; and August 7, 8, 9, 11 and 15.

The temperature enhancement protocol was not required on June 19 and 28 and August 7 and 15 since river flows at Oakland exceeded 100 cfs. Both units were loaded for a 2-hour release on June 30, but Unit-1 tripped and could not be restarted for about 40 minutes. The resultant release was not enough to prevent the temperatures from exceeding 25°C. The protocol required a 1-hour release by 1430 hours on July 1. However, the remote dispatch capabilities between the Houston Dispatch Center and Deep Creek Power Plant malfunctioned and the release did not occur until nearly 1730 hours. The late release failed to maintain river temperatures below 25°C. Deep Creek Power Plant generated for six hours starting at 1225 on August 8 and over 6½ hours starting at 1148 on August 9. Neither release prevented water temperatures from exceeding 25°C. A release was not required per the protocol on June 26 and August 11.

Days when temperatures exceeded 25°C and days when temperature enhancement releases were made are summarized in Appendix B. Log sheets for each of these dates also are enclosed in Appendix B.

1.3 Minimum Flow Release Monitoring

The Permittee operated the flow bypass in accordance with the "Deep Creek Station Flow Bypass Operation Protocol" (May 1995, revised September 2001). Minimum bypass flows were required on 20 dates between September 15 and November 19, 2001. Flows required by the protocol ranged from 2-cfs on several dates to 11-cfs on October 14. Appendix C provides a summary of flow bypass data for 2001. A record of the U.S. Geological Survey data from the Oakland gaging station also is presented in Appendix C.

1.4 Dissolved Oxygen (DO) Monitoring

The Permittee operated the dissolved oxygen enhancement weir during 2001 in accordance with the "Dissolved Oxygen (DO) Enhancement Operations and Monitoring Protocol" approved by the Department on January 6, 1995. Data obtained from monitoring DO in 2001 are included in Appendix D.

The DO levels in the tailrace first fell below 6.0 mg/l on July 19, when the Permittee measured DO levels of 5.54 mg/l. DO levels dropped to 4.34 mg/l on August 13 despite the gates set in the closed or near closed position. This is the first time since implementation of the Protocol that DO levels fell below 6.0 mg/l with the sluice gates nearly closed. The low DO levels measured on July 19 and August 13 both occurred with only one unit operating. Due to high natural flows, Permittee operated only one unit on both dates in accordance with the permit. DO levels were measured on one other date with single unit operation, July 6. DO values were low (6.05 mg/l) but above the standard of 6.0 mg/l. It is possible single unit operation does not provide enough turbulence to raise DO levels as water spills over the weir. This will be monitored closely in future years to determine if alternative gate positioning is required.

Aside from July 19 and August 13, no other DO measurements were below 6.0 mg/l.

1.5 Releases Unsuitable for Whitewater Recreation

Permit Condition 19 outlines several operating rules designed to enhance whitewater boating opportunities in the Youghiogheny River. One operating rule restricts generation during certain times of the day unless flows suitable for whitewater boating also occur.

The specific criteria for this operating rule:

- apply only from April 15 through October 15,
- apply only when the lake is between the upper and lower rule bands,
- may be suspended during emergency conditions described in Condition 14, and
- prohibit releases between 1600 hours and 0800 hours of the following morning unless:
 1. a release providing 3 consecutive hours suitable for whitewater boating occurs during the 0800 to 1600 hour period immediately preceding the release.
 2. a release providing 3 consecutive hours suitable for whitewater boating occurs during the 0800 to 1600 hour period immediately following the release.

Condition 19 requires the Permittee to document "times and dates when generation releases not suitable for whitewater recreation occurred." Using the criteria above, generation releases not suitable for whitewater recreation did not occur during 2001.

1.6 Zebra Mussel Monitoring

Artificial substrates placed at the station intake area during 2001 showed no signs of the zebra mussel infestation.

APPENDIX A

LAKE LEVEL DATA

APPENDIX B

TEMPERATURE MONITORING AND RELEASE REPORTS

MAXIMUM DAILY RIVER WATER TEMPERATURES

Daily maximum river water temperatures in the Youghiogheny River at Sang Run are presented on the following tables. The data were collated and provided by Versar, Inc., consultant to the MDNR Power Plant Assessment Division (PPAD).

The column labeled "SMAX" lists the arithmetic means of the daily maximum water temperatures, in degrees C, measured by two "Tempmentors" placed in the river by the MDNR. The column labeled "PenMAX" lists the maximum water temperatures, in degrees C, measured by the Permittee's temperature monitor at the Sang Run Bridge. PPAD and Versar analyze the data to evaluate the Water Temperature Enhancement Plan used by the Permittee to determine the need and timing of daily temperature releases.

Days when temperatures exceeded 25°C and days when temperature enhancement releases were made are summarized in the following tables. Log sheets for each of these dates also are enclosed.

Exceedance Of 25°C At Sang Run Temperature Probe

DATE	DURATION	MAXIMUM
June 19	15:40 – 19:50	26.2 @ 18:10
June 26	15:50 – 19:20	25.9 @ 17:50
June 28	14:50 – 20:50	26.9 @ 17:20
June 30	14:20 – 15:30	26.3 @ 15:20
July 1	15:20 – 16:10	25.3 @ 15:50
August 7	14:10 – 15:20	25.9 @ 15:00
August 8	14:00 – 14:40	25.6 @ 1430
August 9	13:20 – 14:00	25.3 @ 1340
August 11	16:40 – 19:50	25.6 @ 1840
August 15	16:50 – 18:10	25.2 @ 1710

APPENDIX C

FLOW BYPASS OPERATION RECORD

FLOW BYPASS OPERATION

The flow bypass protocol requires the Permittee to maintain a minimum flow of 40 cfs in the Youghiogheny River immediately downstream of the tailrace. Starting June 1 and continuing through November 30, the Permittee monitors the river flows at the Oakland gage. When flows at the Oakland gage fall below 26 cfs, the Permittee may be required to open a bypass valve to release enough water to maintain 40 cfs in the river immediately below the tailrace.

The following table summarizes flow bypass data for June through November 2001, when flows in the Youghiogheny River were less than 26 cfs. Flow data were obtained from the USGS recording at the Oakland gage, direct readings from the USGS Oakland gage or from the tailrace gage at the station per guidance provided in the protocol. Valve opening was determined from Table 3 of the protocol based on station operating status.

Data from the USGS gaging station at Oakland also are provided. Data for the period of October 1, 2001 through the end of the year are provisional data. USGS data represent daily mean flows and may not agree with instantaneous data collected by the Permittee throughout the year.
